Onge

no specialized physicians, the Onge do not understand that payment can be exacted for medical care. This stems from the fact that wages are not considered by those happy people as payment for any kind of work whatsoever, but only as a gift. I realized this when I tried to pay my guides after our extenuating marches through the jungle : in order to avoid offending the natives that we had casually met in the course of our trip, I had to give equal reward to everybody.

The Onge consider some men or women better endowed than others with anti-malefic influence ; but these too neither demand nor receive wages for their services. Evil spirits or evil persons are believed to be principally responsible for illness. A series of superstitions and remarkable habits derive from this belief. The above-mentioned precautions concerning the *naquinēghē* are among them. For identical reasons they carefully hide hair cuttings, but not nail parings, for the simple reason that nails are never cut but worn down by digging for edible roots, fishing, and other rough work. Superstition, as we know, is also the reason for painting the body to prevent fever and other ills.

In the depths of their jungle the Onge appear to practice some kind of witchcraft. On several occasions I noticed the mysterious behaviour of some natives travelling with me. Occasionally a man left our marching column to examine the inside of a huge hollow tree and signal to his friends. They did not prevent me from looking into the hollow, where I saw only a simple structure of short sticks resembling a trap without being one. The Onge do not use traps ; moreover, those structures were far too flimsy to catch anything. Often, two or three men assembled in consultation, rearranged the sticks that had probably been dislodged by the passage of lizards, crabs or other small animals, and walked away silently. I could get no explanation on the matter. Certainly the Onge are sagacious observers of animal and vegetable life and have deep knowledge of their hidden properties. Some trees are probably used for magical purposes, but, I insist, it is impossible as yet to affirm it. The structures in question consisted of four vertical sticks, about 30 cms long, joined at the top by four more sticks of approximately the same length, placed horizontally. The result was a box-like frame, loose and unsecured. The slightest disturbance, such as a light breeze, could destroy the flimsy construction. As far as I could guess they invested those structures with curative properties, but in what manner remains a mystery. I noticed analogous practices among Central African Pygmies and other primitives.

It is very clear that the Onge dread illness and magic spells, for they consider themselves at a loss in fighting such evils. Unhygienic habits are of no importance to them.

Resting is considered favorable to good health. The Onge indulge voluptuously in rest, interrupting it, however, with too frequent sexual excursions. They mainly rest from doing nothing, because 90 % of their time is spent in what, for them, is the most agreeable manner of enjoying life.

In mid-March, when the honey harvest reaches its peak, the Onge guzzle

Onge

262 immense quantities of it together with pork. I was with them three times when this recurred, so I could observe their behaviour exhaustively. With their
517 bellies full, the natives rest. Their only activity is body painting, performed by
302 the women on the skin of their peacefully sleeping husbands. Designs change
178 from time to time as I said before, according to the women's inventiveness. Each family challenges the others in renewing their patterns. The best are later reproduced until the next change. From year to year I noticed no real evolution in this rudimentary art, but a cyclical fashion, with temporary preference, in males and females alike, for some geometrical designs, unconnected with whatever kind of food they had been eating. This contradicts the published af-
114 firmations of several authors, who allege that the Andamanese paint special
302 patterns in special colours for different kinds of food. There is nothing more
[262] false, at least with reference to the Onge. Merry feasting, whether on pork
[751] turtle, dugong, fish or honey, leads to a period of rest and body decoration –
[515] always in similar patterns and colours – with the unique purpose of preventing illness. We might say that painting the body is equal to cleaning it, but this is quite unintentional. A curious exception to the Onge's filthy habits is the
264 practice of sweeping the floor after solemn banquets in communal huts. The
356 surface of the floor consists of unpacked earth hardened by casual tramping.
342 When it is dry, sweeping raises a heavy dust that fills the hut to the ceiling.
251 It deposits there on the wooden beams where the Onge like to store cooked
262 victuals. So they eat their food, as I said before, coated with dust, no matter
412 how thick. A brush without a handle is used to sweep the floor ; it is 80 cms long and no thicker than a man's wrist. It is one of the nicest tools made by the Onge, and consists of strong, hard, elastic palm fibres bound together with strips of rattan. The dirt is simply thrown out all around the hut, by pushing
356 it under the roof mats that never reach the ground.

114 These notes offer a first glimpse into a peculiar aspect of Onge life. It is to be deplored that these vanishing people have not yet been exhaustively studied, notwithstanding their anthropological interest and high biological significance.

ONGE

the felling of the tree, chiselling the lumber and processing it further to give the shape of a canoe. Buckets of wood are also constructed by them from the softwood tree. Two types of baskets are made, the smaller ones are more well-finished than the bigger ones. The former is known as *toleoaga* and the later *tole-laya*. Such activities have introduced the use of dahs, chisels, and iron files among the Onges, from the iron pieces derived from the sea shores. The other important pieces of their craftsmanship are the beautiful weavings of fibre, tussel of yellow fibre used by the women in their front. However, the art of making the earthen pots has been completely forgotten.

The leisure in their lives has helped the development of some amount of aesthetic senses among the Onges. All the Onges men and women shave their heads with flakes of glass, obtained from the sea-borne glass bottles. The body of the Onges are also painted with white clay which save their skin from insect-bite while red paint serves medicinal purposes if some individual is having fever. In times of mourning, red ochre paint is a taboo.[1]

Early marriage is the custom. The widows are looked down upon by the society. Some incidents of widow murder and drowning are heard. In the married life, the husband is devoted to his wife and both the husband and wife work for collecting their food.

Dances and songs are in vogue and there are practically songs for every occasion and activity. Most of their songs are more plaintive than joyous.

There are three broad divisions of the Onges of the Little Andaman :

(1) *Giremeka-Gobeule* group inhabiting the northeastern coast of the island ;

(2) *Engakwale group* live in the interior of the islands ; and

(3) *Gireraragobeule group* live in the southern and western coasts of the islands.

In spite of all the limitations, the Onges have been considered as one of the happiest people of the world with plenty of food and water to eat and drink and with very few social cankers to fight with. But as is common to all other aborigines of the Andamans, a decline in their number is discernible.

The Sentinelese

The Sentinelese are the least known of all the aborigines of the Anda-
